Dear Yiota and Dimitris,

attached is the list of alternative spliced (AS) genes in the overall RNAseq wt vs ko comparison. As the requirement to have the same alternative form in all conditions is too strict, I tested for alternative splicing in each condition and report the condition where AS occurs in the column maxAnticorrCond. These 19 genes thus have significant differential expression for 2 isoforms in the overall wt vs ko comparison and the expression of these 2 isoforms is anticorrelated (≤ -0.5) in at least one condition.

BW,
Martin
